EXAMINER

ABRAHAM, ESAW T

ART UNIT PAPER NUMBER

2133

DATE MAILED: 10/27/2006

Please find below and/or attached an Office communication concerning this application or proceeding.

Office Action Summary	Application No.	Applicant(s)	
	10/694,881	PALIN ET AL.	
	Examiner	Art Unit	
	Esaw T. Abraham	2133	

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on Amdt filed on 08/10/06.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 36-39 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☒ Claim(s) 1,3-23 and 25-35 is/are allowed.
- 6) ☒ Claim(s) 38 and 39 is/are rejected.
- 7) ☒ Claim(s) 36 and 37 is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☒ The drawing(s) filed on 10/29/06 is/are: a) ☒ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
 2. ☐ Certified copies of the priority documents have been received in Application No. _____.
 3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

DETAILED ACTION

Response to the applicant's amendments and remarks

Applicant's arguments, see pages 9-10, filed 08/22/06, with respect to the rejection(s) of claim(s) 1-35 under 35 USC 103(a) have been fully considered and are persuasive. Therefore, the rejection has been withdrawn.

Status of Claims

1. Claims 36-39 remain pending.
2. Claims 1, 3-23 and 25-35 have been allowed.

Claim objections

3. Claim 36 is objected to because:

The claim (claim 36) recite, the phrase "adapted to" since "adapted to" only suggests or makes optional and fails to further limit the claim.

The examiner's suggestion is to replace the phrase "adapted to" to ---configure to--- (see lines 2 and 7)

Claim 37 is rejected due to the dependency on a rejected base claim (claim 36).

Claim Rejections - 35 USC § 101, Non Statutory

4. Claims **38 and 39** are rejected under 35 U.S.C. 101 because the claimed invention is directed to non-statutory subject matter because: the claimed invention is directed to non-statutory subject matter.

Art Unit: 2133

Claims 38 and 39 are not statutory as these claims are directed toward software per se and lack the program steps as being stored in a medium, which enables the functionality of the instructions to be executed.

For example the claims can be amended as " A computer program stored on a computer readable media"

Allowable subject matter

5. Claims 36-39 would be allowable if rewritten to overcome the objection and rejection(s) under 35 U.S.C. 101, set forth in this Office action and to include all of the limitations of the base claim and any intervening claims.

Examiner's statement for reason for allowance

6. Claims 1, 3-23 and 25-35 have been allowed.

The following is an examiner's statement for allowance:

As per claim 1:

The prior art of record teach (U.S. PN: 6,961,541) Overy et al. substantially discloses a method and system for providing enhanced loop security by measuring a distance between transceivers (see line 1, lines 32-35). The method is embodied in an apparatus that establishes a wireless connection between an initiating device and a responding device by computing a distance or location of the responding device in conformity with a channel time delay between the responding device and one or more receivers. At least one of the receivers may be located within the initiating device or one or more of the receivers may be external to the initiating device. If the computed

Art Unit: 2133

location indicates that the responding device is a desired device, a secure connection is then established between the initiating device and the responding device (see col. 3, lines 27-40). Sharma et al. (U.S. PN: 6,799,287) teach an error injection module is used to inject random errors into an ECC circuit between an encoder and a decoder. The encoder encodes data bits with check bits to produce an encoded signal and a decoder decodes (convert) the encoded signal, after modification by the error injection module (see col. 2, lines 34-50 and figure 3B). However, the prior art taken singly or in combination fail to teach, anticipate, suggest, or render obvious a method of providing communications security, the method comprising: (a) generating a protected content stream from a data stream; (b) transmitting the protected content stream across a first short-range radio communications link; and (c) transmitting across a second short-range radio communications link information for converting the protected content stream into the data stream; wherein the protected content stream comprises a packet, and wherein step (a) comprises inserting one or more errors into the packet.

Consequently, claim 1 is allowed over the prior art.

Claims 3-21, which is/are directly or indirectly dependent/s of claim 1 are also allowable over the prior art of record.

As per claim 22:

The prior art of record teach (U.S. PN: 6,961,541) Overy et al. substantially discloses a method and system for providing enhanced loop security by measuring a distance between transceivers (see line 1, lines 32-35). The method is embodied in an apparatus that establishes a wireless connection between an initiating device and a

Art Unit: 2133

responding device by computing a distance or location of the responding device in conformity with a channel time delay between the responding device and one or more receivers. At least one of the receivers may be located within the initiating device or one or more of the receivers may be external to the initiating device. If the computed location indicates that the responding device is a desired device, a secure connection is then established between the initiating device and the responding device (see col. 3, lines 27-40). Sharma et al. (U.S. PN: 6,799,287) teach an error injection module is used to inject random errors into an ECC circuit between an encoder and a decoder. The encoder encodes data bits with check bits to produce an encoded signal and a decoder decodes (convert) the encoded signal, after modification by the error injection module (see col. 2, lines 34-50 and figure 3B). However, the prior art taken singly or in combination fail to teach, anticipate, suggest, or render obvious a wireless communications device, comprising: means for generating a protected content stream from a data stream; means for transmitting the protected content stream across a first short-range radio communications link; and means for transmitting across a second short-range _radio communications link information for converting the protected content stream into the data stream; wherein the protected content stream comprises a packet having one or more inserted errors, the one or more errors at one or more corresponding positions within the packet. Consequently, claim 22 is allowed over the prior art.

As per claim 23:

Art Unit: 2133

The prior art of record teach (U.S. PN: 6,961,541) Overy et al. substantially discloses a method and system for providing enhanced loop security by measuring a distance between transceivers (see line 1, lines 32-35). The method is embodied in an apparatus that establishes a wireless connection between an initiating device and a responding device by computing a distance or location of the responding device in conformity with a channel time delay between the responding device and one or more receivers. At least one of the receivers may be located within the initiating device or one or more of the receivers may be external to the initiating device. If the computed location indicates that the responding device is a desired device, a secure connection is then established between the initiating device and the responding device (see col. 3, lines 27-40). Sharma et al. (U.S. PN: 6,799,287) teach an error injection module is used to inject random errors into an ECC circuit between an encoder and a decoder. The encoder encodes data bits with check bits to produce an encoded signal and a decoder decodes (convert) the encoded signal, after modification by the error injection module (see col. 2, lines 34-50 and figure 3B). However, the prior art taken singly or in combination fail to teach, anticipate, suggest, or render obvious a method of providing communications security, the method comprising: (a) receiving a protected content stream from a first short-range radio communications link; (b) receiving from a second short-range radio communications link information for converting the protected content stream into a data stream; and (c) generating the data stream from the protected content stream; wherein the protected content stream comprises a packet having one or

more inserted errors, the one or more errors at one or more corresponding positions within the packet. Consequently, claim 23 is allowed over the prior art.

Claims **25-32**, which is/are directly or indirectly dependent/s of claim 23 are also allowable over the prior art of record.

As per claim 33:

The prior art of record teach (U.S. PN: 6,961,541) Overy et al. substantially discloses a method and system for providing enhanced loop security by measuring a distance between transceivers (see line 1, lines 32-35). The method is embodied in an apparatus that establishes a wireless connection between an initiating device and a responding device by computing a distance or location of the responding device in conformity with a channel time delay between the responding device and one or more receivers. At least one of the receivers may be located within the initiating device or one or more of the receivers may be external to the initiating device. If the computed location indicates that the responding device is a desired device, a secure connection is then established between the initiating device and the responding device (see col. 3, lines 27-40). Sharma et al. (U.S. PN: 6,799,287) teach an error injection module is used to inject random errors into an ECC circuit between an encoder and a decoder. The encoder encodes data bits with check bits to produce an encoded signal and a decoder decodes (convert) the encoded signal, after modification by the error injection module (see col. 2, lines 34-50 and figure 3B). However, the prior art taken singly or in combination fail to teach, anticipate, suggest, or render obvious a wireless communications device, comprising: means for receiving a protected content stream

Art Unit: 2133

from a first short-range radio communications link; means for receiving from a second short-range radio communications link information for converting the protected content stream into a data stream; and means for generating the data stream from the protected content stream wherein the protected content stream comprises a packet having one or more insert errors, the one or more errors at one or more corresponding positions within the packet. Consequently, claim 33 is allowed over the prior art.

As per claim 34:

The prior art of record teach (U.S. PN: 6,961,541) Overy et al. substantially discloses a method and system for providing enhanced loop security by measuring a distance between transceivers (see line 1, lines 32-35). The method is embodied in an apparatus that establishes a wireless connection between an initiating device and a responding device by computing a distance or location of the responding device in conformity with a channel time delay between the responding device and one or more receivers. At least one of the receivers may be located within the initiating device or one or more of the receivers may be external to the initiating device. If the computed location indicates that the responding device is a desired device, a secure connection is then established between the initiating device and the responding device (see col. 3, lines 27-40). Sharma et al. (U.S. PN: 6,799,287) teach an error injection module is used to inject random errors into an ECC circuit between an encoder and a decoder. The encoder encodes data bits with check bits to produce an encoded signal and a decoder decodes (convert) the encoded signal, after modification by the error injection module (see col. 2, lines 34-50 and figure 3B). However, the prior art taken singly or in

Art Unit: 2133

combination fail to teach, anticipate, suggest, or render obvious a wireless communications device, comprising: a controller configured adapted-to generate a protected content stream comprising a packet from a data stream by inserting one or more errors into the packet; a first transceiver adapted to transmit the protected content stream across a first short range radio communications link; and a second transceiver adapted to transmit across a second short-range radio communications link information for converting the protected content stream into the data stream. Consequently, claim 33 is allowed over the prior art.

Claim 35 which is/are directly or indirectly dependent/s of claim 34 is also allowable over the prior art of record.

Conclusion

7. Any inquiry concerning this communication or earlier communication from the examiner should be directed to Esaw Abraham whose telephone number is (571) 272-3812. The examiner can normally be reached on M-F 8-5.

If attempts to reach the examiner by telephone are successful, the examiner's supervisor, Albert DeCady can be reached on (571) 272-3819. The fax phone numbers for the organization where this application or proceeding is assigned (571) 273-8300.

Information regarding the status of an Application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or PUBLIC PAIR. Status information for unpublished applications is available through Private Pair only. For more

Art Unit: 2133

information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
